Abstract

Television shows and movies about time travel fascinate many people and often generate questions such as whether time travel is possible and, has it actually occurred. Here a search for ‘evidence of time travel back to the past’ in historical records in the era prior to the internet age was undertaken. The objectives were to construct a basis of analysis, locate ancient texts within the search criterion, then examine those selected ancient texts for the presence of time travellers and/or associated prescient content. The aim was to answer the question “do ancient texts document time travellers from the future?” For a result to be validated as positive, an ancient text had to relate that a person from the future was physically present and he described specific future events that can now be verified from contemporary history books. Several texts were found that do in fact document time travellers from the future and contain associated prescient content. A named human time traveller was also identified. These positive results reveal that time travel back to the past has taken place. This new knowledge will induce a whole new sphere of study and precipitate a change in thinking both in the scientific and religious worlds.

Abstract

It was established, by the South Australian researcher Eddy Pengelly in his March/June 2014 Paper, that time travellers went back to the past to many different times and to different countries, and told certain ancient persons of specific future events. Associated with those ancient reports are descriptions of an apparatus and two artifacts. Here a search to establish the identity of those devices was undertaken. The objectives were to: collate a list of ancient texts that contain descriptions of the apparatus and artifacts; compile an extraction of attributes; filter out any mistranslations; and then compare those descriptions to known technology in an attempt to identify what was seen back in the past. To confirm the identity of the apparatus and artifacts and to generate a positive result, an exact match of described ancient attributes to any such actual technology was required. A mid 1990s desktop computer was identified as the apparatus, and compact disks as the artifacts. These positive results demonstrate that particular computer technology was taken back to the past and shown to certain historical people. A new term was introduced for these findings - DOOPArt, an acronym for 'documented-out-of-place artifact'. This new knowledge will instigate a whole new sphere of study and continue to precipitate a change in thinking both in the scientific and religious worlds.

Abstract

It was established, by the South Australian researcher Eddy Pengelly in his October 2014 Paper, that a mid 1990s computer system and two associated compact disks are documented in certain ancient texts. Here a search to establish the identity of one of those compact disks was undertaken. The objectives were to: collate a list of ancient texts that contain accounts of compact disks; extract and compile a list of their characteristics and described contents from those ancient texts; filter out any mistranslations; and then compare those features to particular compact disks in an attempt to find the one described in those ancient texts. To confirm its identity and to generate a positive result, an exact match of documented ancient characteristics and described content with the actual contents of a single cd-rom was required. The 1995 French produced multimedia cd-rom entitled *Ancient Civilizations of the Mediterranean* was comprehensively identified. This positive result demonstrates that a particular cd-rom from the mid 1990s was taken back to the past and shown to certain historical people. This disclosure will continue to provoke a change in thinking in the scientific world regarding the topic of time travel, and will finally and comprehensively reveal to Religions upon what their traditional stories are actually based.
